"Celebrating twenty-five years of the political freedom in Germany", Berlin, November 11, 1871.Q: How to create a filter in TPL that accepts a list of string and return its length? I'm not actually proficient in TPL, so bear with me. I need to create a filter that accepts one

parameter that is a list of strings and return the length of this list. If I write: public int count(List arguments) I can get as well arguments.Count() I know I can create a : public int count(string[] arguments) However, I want to pass a list (as a parameter of a method). I'm not able to understand how to make a generic method work with this. Is it possible? I want the count method to accept either a string[] or a List. Update I do know how to add a filter if I take a list of strings, but not with a List as a parameter. Is it even possible? A: If you absolutely need a generic method then you can write something like this public int count(List arguments) {

Kaskusoku no Umi to Keiyakusho no Yoko (25 P) - A Full-Movie of 100 Min - Anime / Internet / Manga / Animes. tags: download, english, ori-yoko-0, as.. 3 pages - Kodansha ComicsQ: I tried to instantiate a class with the new operator, but it does not work I tried to instantiate a class with the new operator, but it does not work. So, here is what I do: class Car : public Base { virtual void printCar(); } class PowerCar : public Car { virtual void printCar(); } void main() { Car *car; car = new PowerCar; car->printCar(); } I got the error: error C2079: 'PowerCar::printCar' uses undefined struct/union 'Base', which is undefined. Why can't I instantiate a class using the new operator? A: The

problem is that you defined a new function in PowerCar for a virtual function you didn't actually define. You need to define printCar, or call a function that did define the virtual function. For example: class Car : public Base { virtual void printCar(); } class PowerCar : public Car { void printCar() override; } void main() { Car *car; car = new PowerCar; car->printCar(); } or, if you prefer lambdas: class Car : public Base { virtual void printCar(); } class PowerCar :
